Monitoring

- Chemical and microbial parameters at Te Ngawai Bridge since 1995
- Invertebrate health at Te Ngawai Bridge since 1999
- Investigation of periphyton at Clelands Bridge Jul 2011 - 2014
- One year monitoring at Manahune Site, and TVIS race near bottom pond (2015/16)

**Environment
Canterbury
Regional Council**

Indicators

- Nitrogen and Phosphorus – nutrients encourage algae growth
- Nuisance periphyton and cyanobacteria
- E. coli -affect suitability for swimming, wading, drinking (including livestock).
- Total suspended solids – sedimentation
- QMCI – index of invertebrate community health

**Environment
Canterbury
Regional Council**
Kaunihera Taiao ki Waitaha

Nutrients

Can promote
nuisance
growths

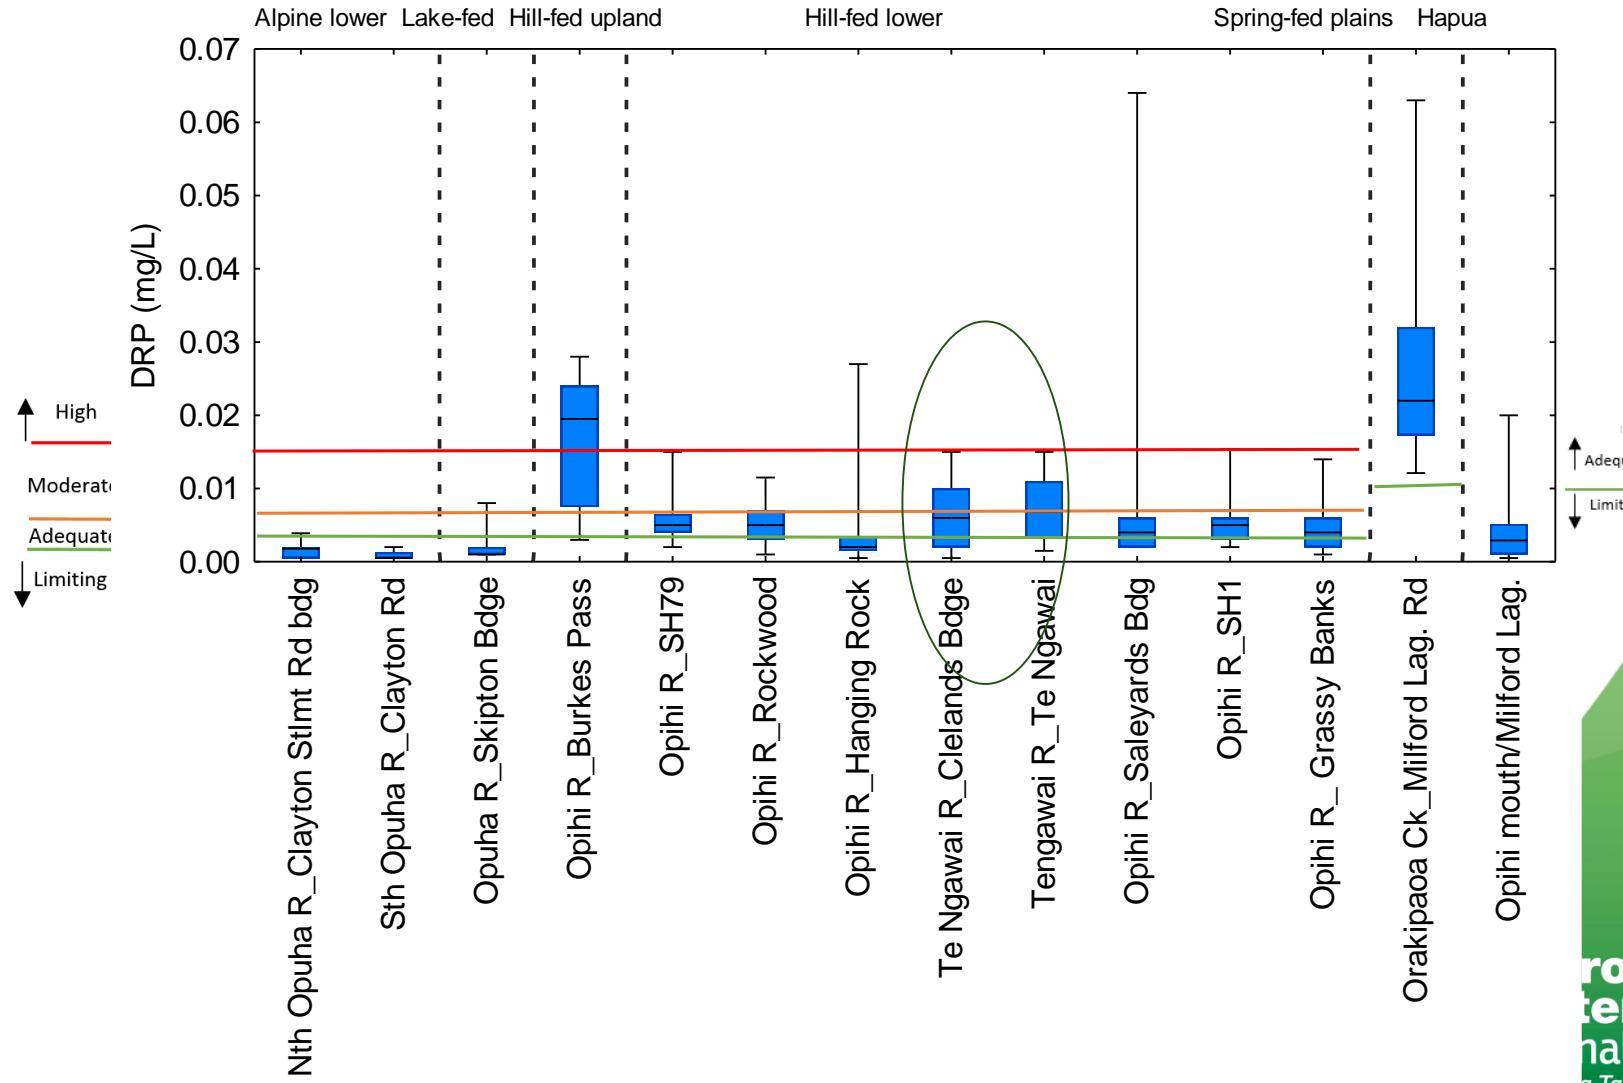

Phormidium –
potentially toxic

Ammonia and nitrate can be toxic to
aquatic life at high levels

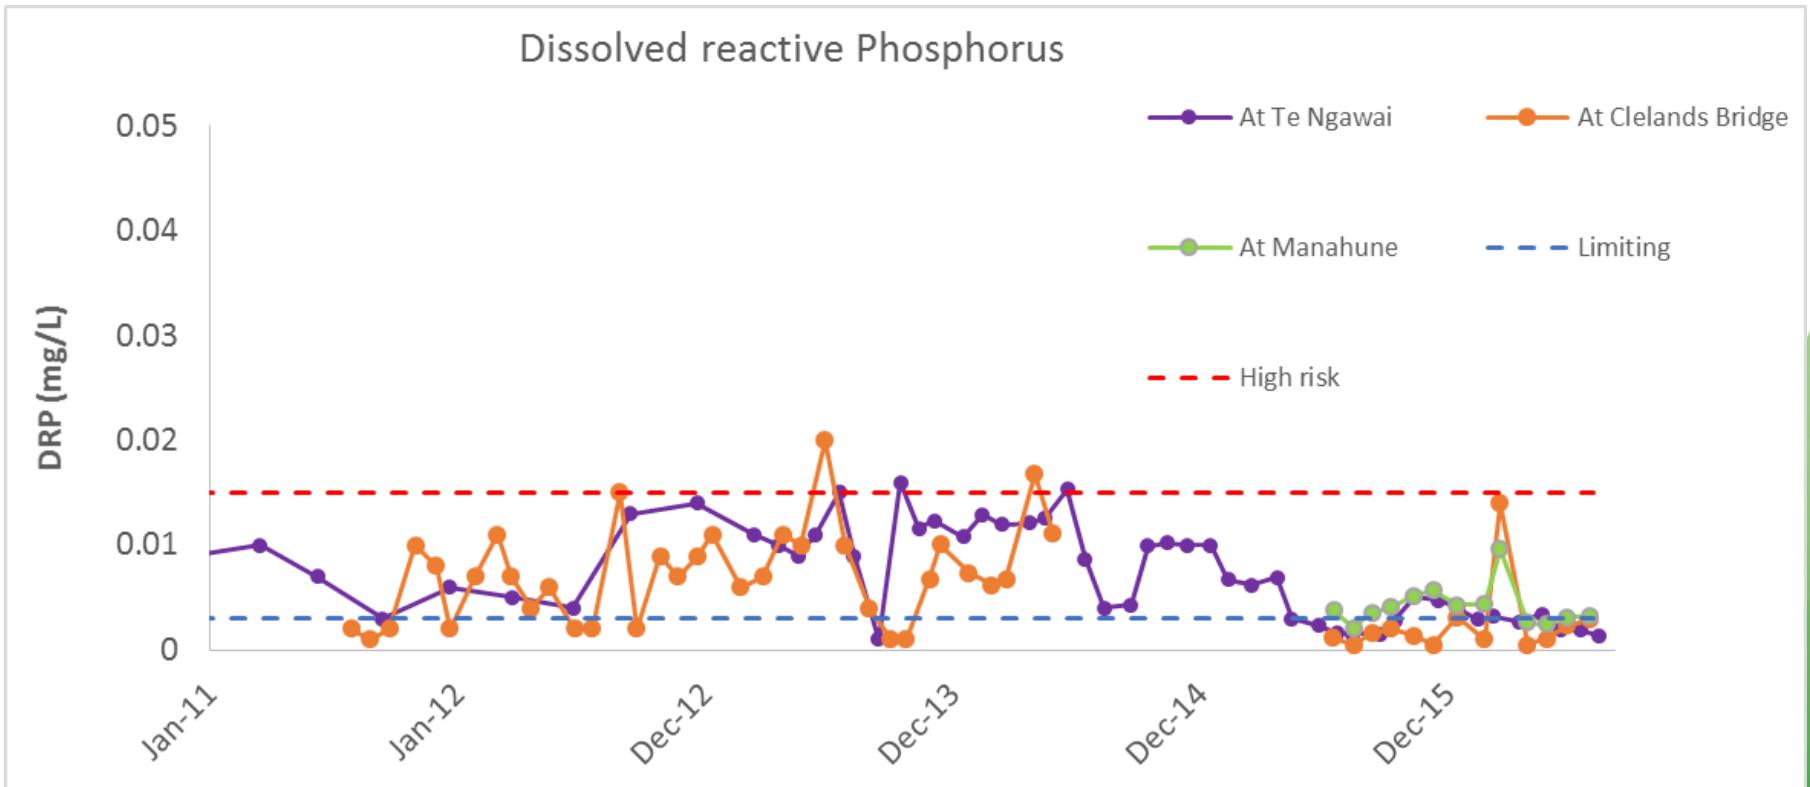

**Environment
Canterbury**
Regional Council
Kaunihera Taiao ki Waitaha

Opihi - phosphorus

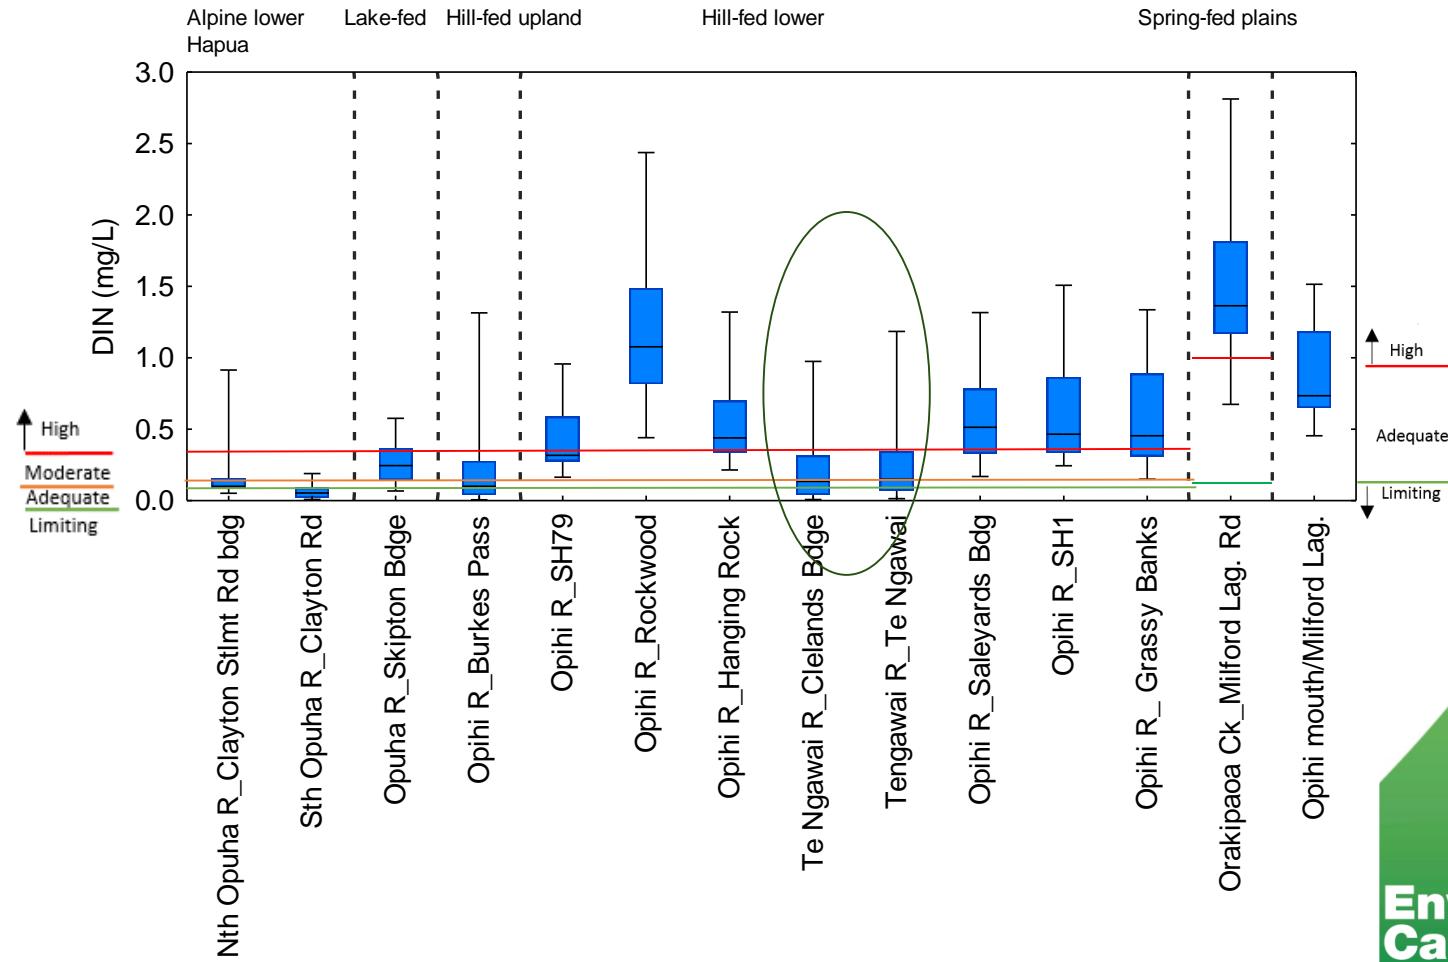

Te Ngawai - Phosphorus

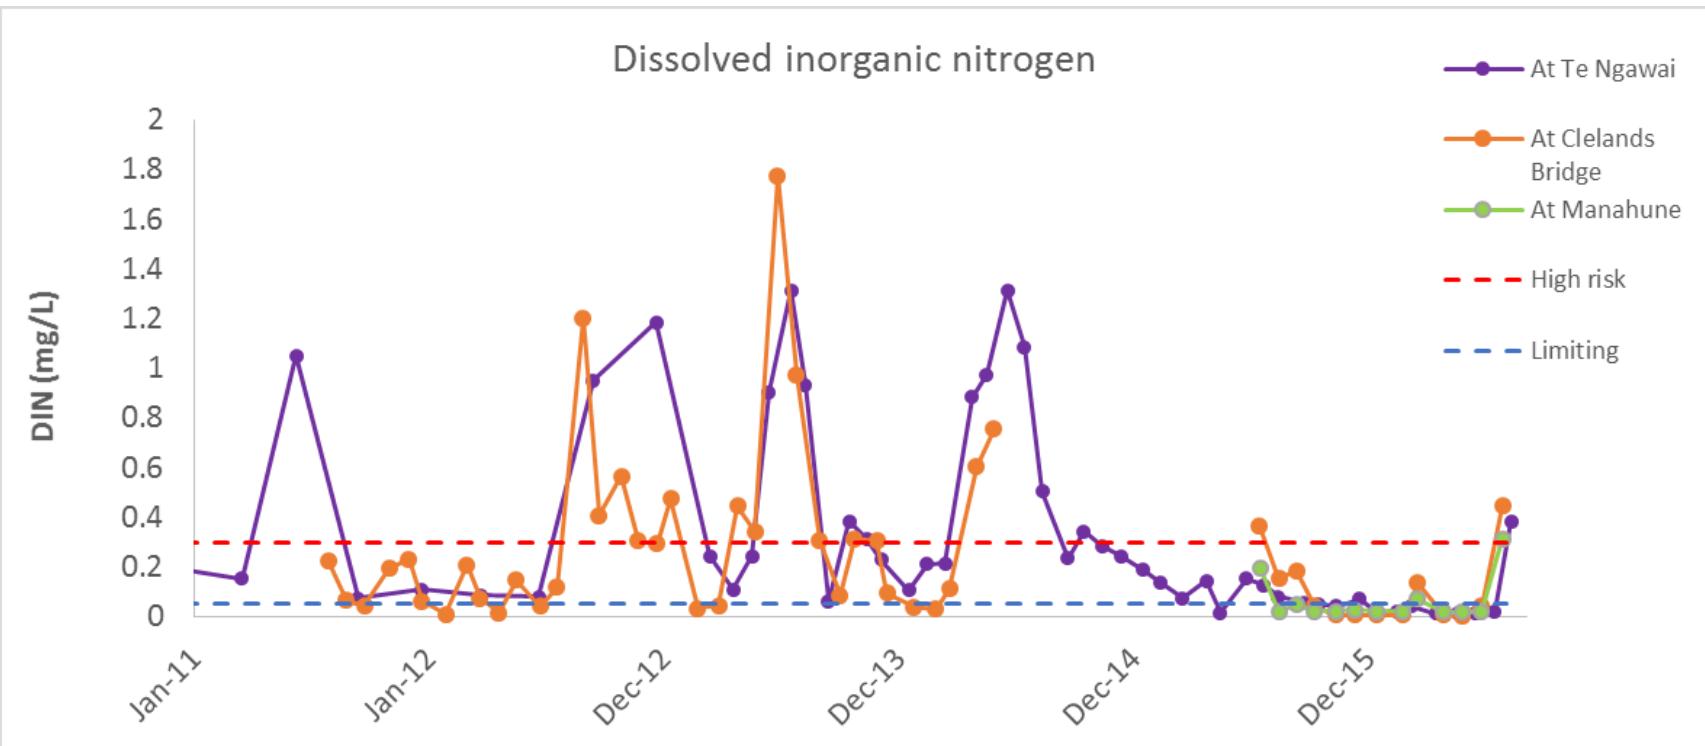

Environment

Regional Council
Kaunihera Taiao ki Waitaha

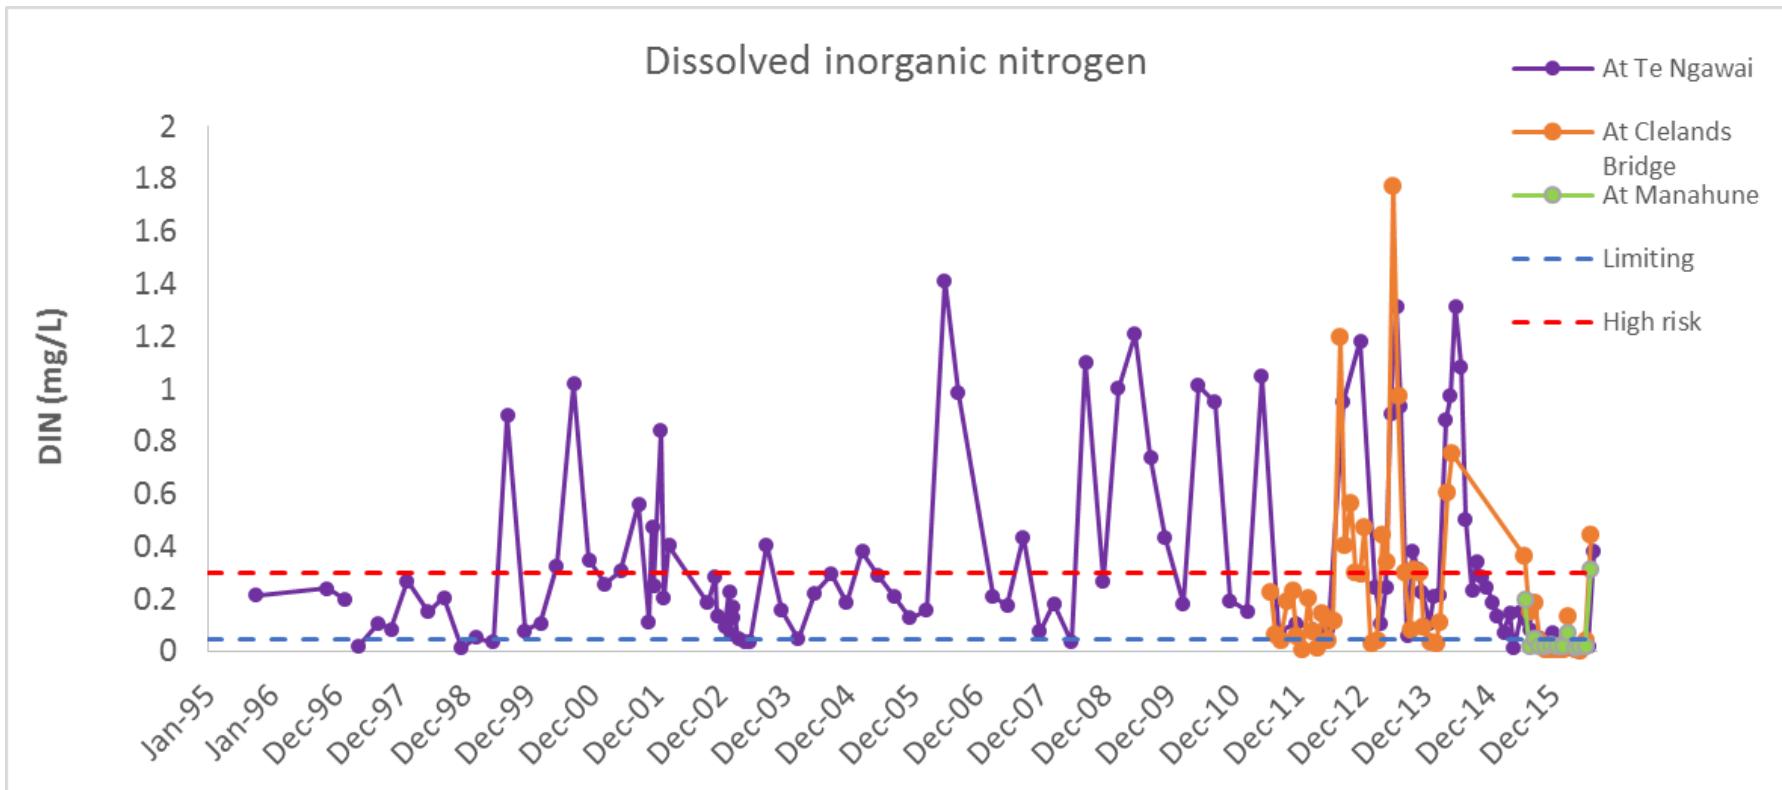

Opihi – nitrogen – 5 yr data

Te Ngawai - Nitrogen

Longer term trends - nitrogen

Periphyton – river slime!

High biomass - Nuisance growths

- Degrade habitat for invertebrates and fish
 - Poor quality food for invertebrates
 - Creates fluctuations in pH and amount of dissolved oxygen
 - Unsightly, unsafe for swimming or wading
 - Cyanobacteria – form of periphyton that is potentially toxic
- Needs combination of nutrients, stable flows, sunlight penetration, warm temperatures, coarse substrate

06.09.2

Periphyton biomass – measured as chlorophyll a

Te Ngawai River Clelands Bridge	Average Chlorophyll a (periphyton) mg/m ²	Maximum Chlorophyll a (periphyton) mg/m ²
2011/12	45.9	252.0
2012/13	15.5	60.1
2013/14	16.3	76.6

Dry year

**Environment
Canterbury
Regional Council**
Kaunihera Taiao ki Waitaha

Cyanobacteria - mostly phormidium

Percentage cover of cyanobacteria observed at Te Ngawai Bridge

Year	Max cover of cyanobacteria (%)
2012/13	0
2013/14	0
2014/15	2
2015/16	40

Public health warning issued

Swimmability / wadability

- Based on E. coli concentrations.
- E. coli indicates the risk of contamination of waterways with faecal material

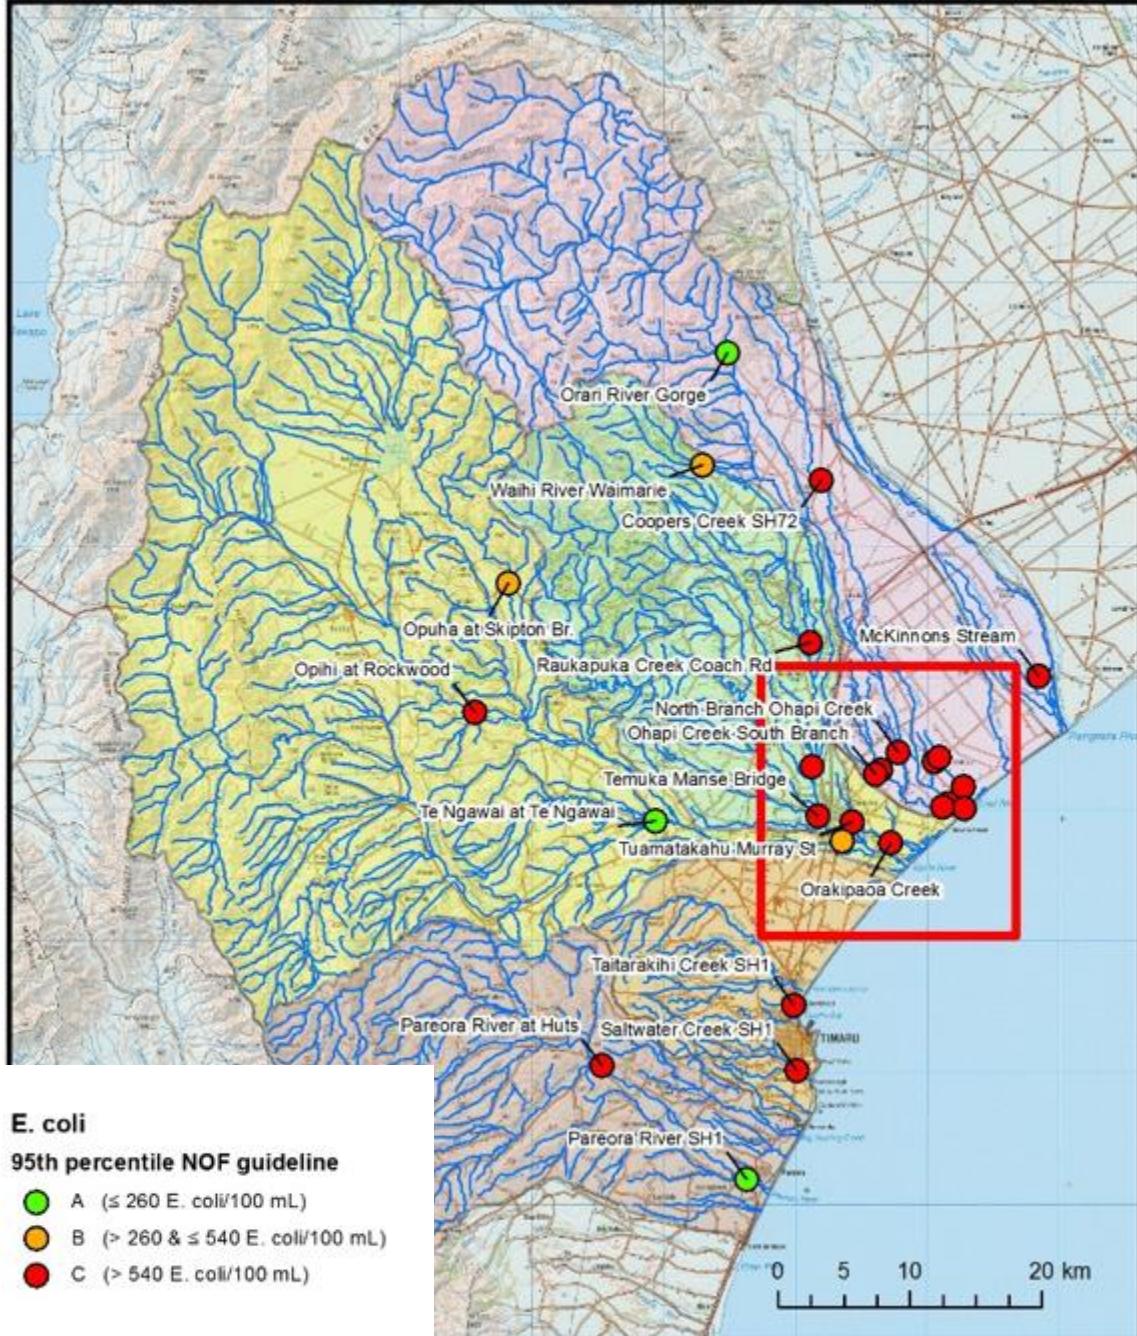

**Environment
Canterbury
Regional Council**
Kaunihera Taiao ki Waitaha

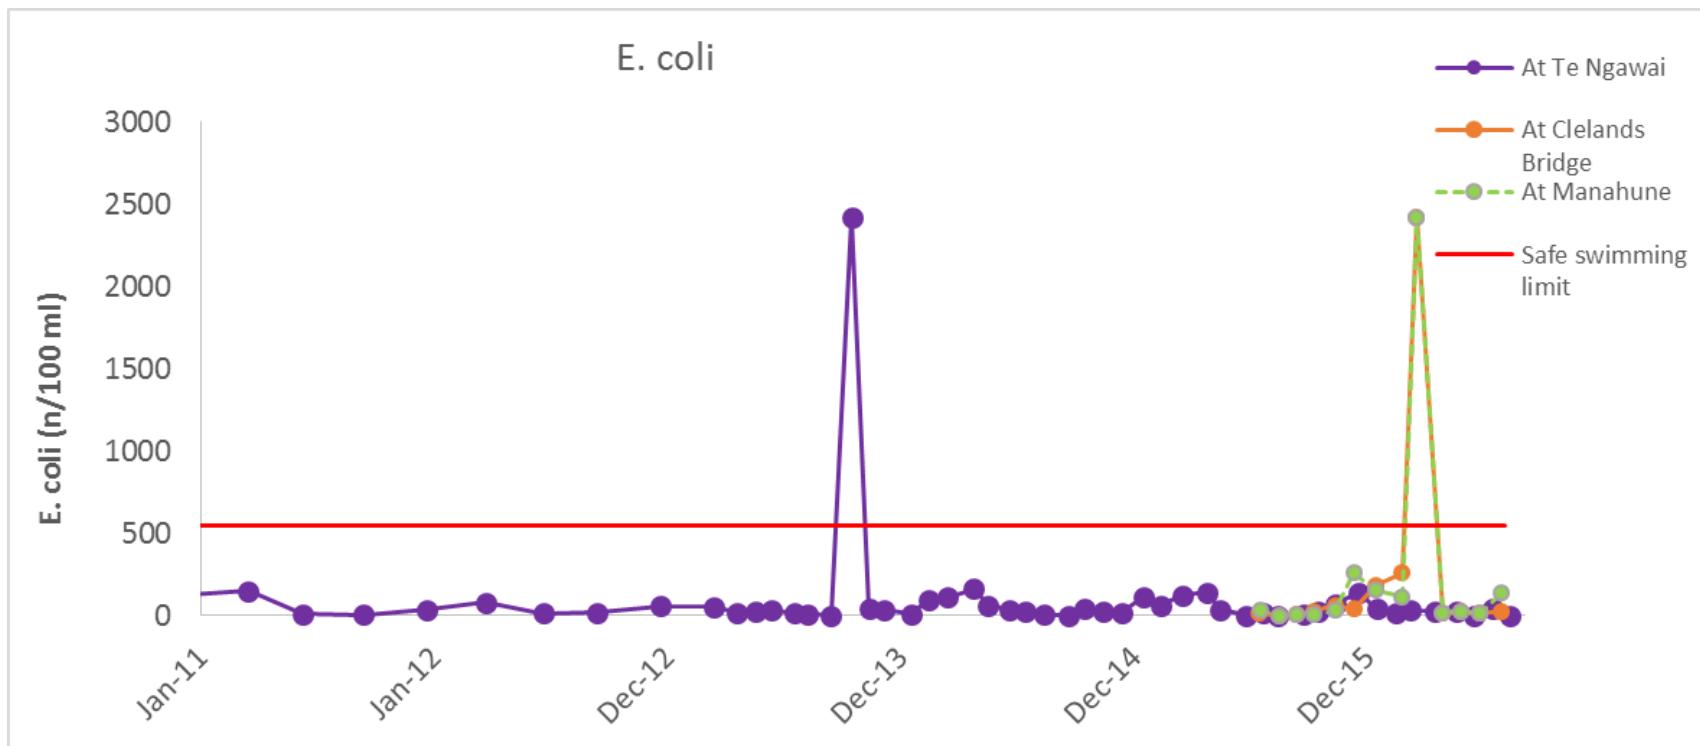

Assessment against NPS criteria for wadability (partial immersion)

Assessment against NPS criteria for swimming

Te Ngawai – E. coli

Invertebrates - QMCI

Mayflies
Deleatidium sp.
9 score

Potamopyrgus sp.
Snails
4 score

Increasing sensitivity to poor water quality or habitat quality

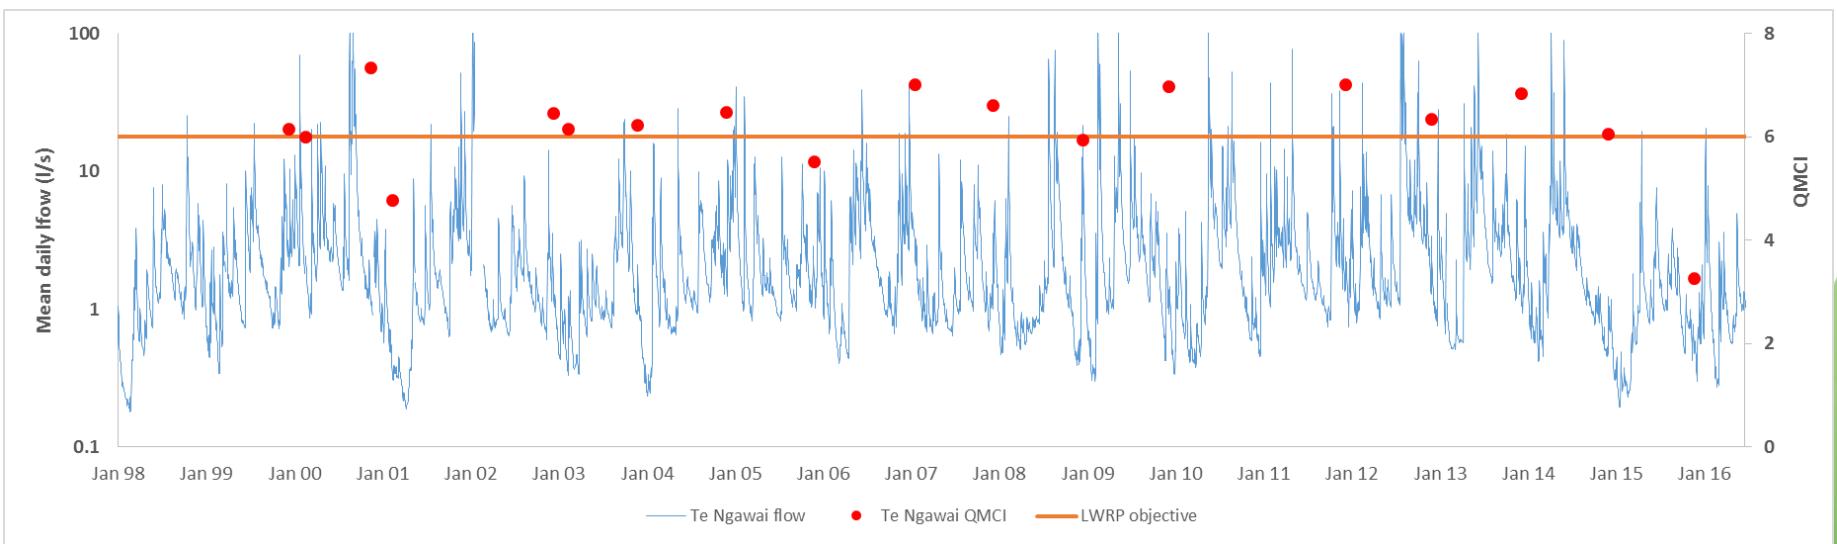

Midges
Chironomids
2 score

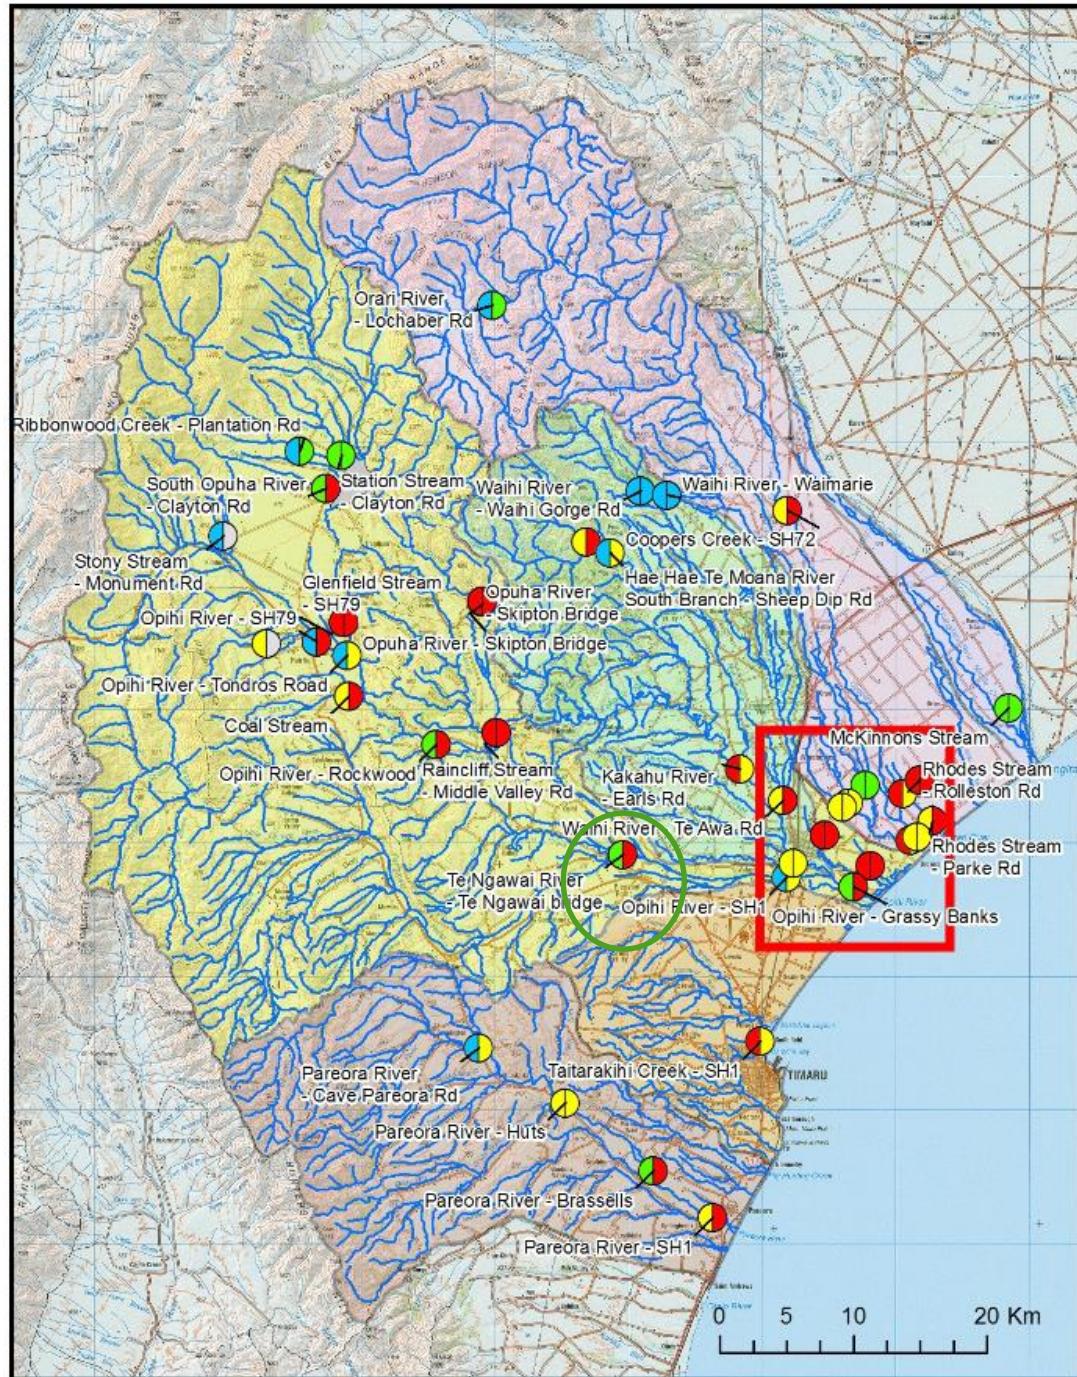

**Environment

QMCI – invertebrate health

Te Ngawai bridge

Invertebrate health indicative of 'good' to 'excellent' water quality most of the time.....

TVIS

- Water taken from Opihi River – near Raincliff
- Historically discharged into Te Ngawai River above Te Ngawai Bridge monitoring site
 - Previous studies indicated that the historical discharge contributed to lower Te Ngawai River over summertime period
 - approx.
 - 75% of E. coli load
 - 90% of nitrogen load
 - 40% of phosphorus load

This discharge no longer occurs!

**Environment
Canterbury
Regional Council**
Kaunihera Taiao ki Waitaha

Summary

- Low to moderate N concentrations, higher in winter
- Moderate P concentrations
- E. coli concentrations low
- Invertebrate community healthy good to excellent – except last year!
